The CRSP will not be distributing this publication. Copies may be obtained by writing to the authors.

**Abstract:** Results of a 120-day study showed that Nile tilapia fingerlings produced in incubation units, hapas or ponds exhibited similar growout performance. Although not statistically significant, the tilapia from artificial incubation units performed optimally. Fish from hapas also did very well. These treatments produced the greatest yield of fish, and a greater proportion of harvested animals fell in larger size categories.

This abstract was excerpted from the original paper, which was published in *Global Aquaculture Advocate*, pp.98-100, September/October 2009.
